

## Native 64-bit Code (New)

- SCC MediaFactory 10 is now a native 64-bit application, providing unlimited access to server memory, resulting in greatly enhanced multi-channel performance. As is true for all 32-bit applications, versions of SCC MediaFactory prior to version 10 were limited to 2GB of server memory.

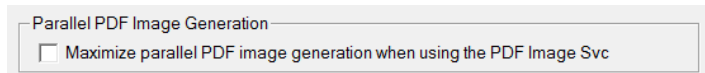

## Advanced Memory Management (New)

- SCC MediaFactory 10 adds a new preference setting which allows the maximum number of channels performing simultaneous high-resolution image decompression to be configured.
- The new default values significantly improve channel processing throughput when sufficient server memory is available.

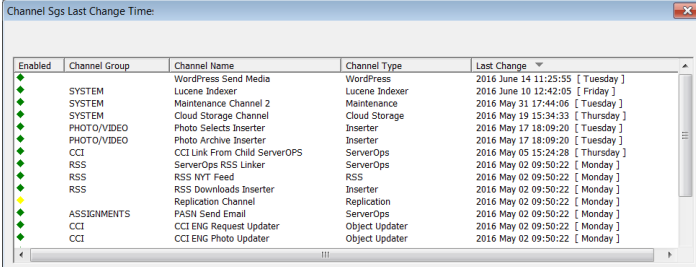

## Parallel PDF Processing (Enhanced)

- SCC MediaFactory 10 adds a new preference setting which allows inserter channels performing PDF processing to operate in parallel.
- When this option is enabled multi-channel PDF processing throughput is significantly improved.

## Channel Settings Change Detection (New)

- SCC MediaFactory 10 now records the date and time of the last change made to each individual channel configuration.
- A new dialog allows the last change date and times to be viewed for all configured MediaFactory channels.

Enabled	Channel Group	Channel Name	Channel Type	Last Change
✓	SYSTEM	WordPress Send Media	WordPress	2016 June 14 11:25:55 [ Tuesday ]
✓	SYSTEM	Lucene Indexer	Lucene Indexer	2016 June 10 12:42:05 [ Friday ]
✓	SYSTEM	Maintenance Channel 2	Maintenance	2016 May 31 17:44:06 [ Tuesday ]
✓	SYSTEM	Cloud Storage Channel	Cloud Storage	2016 May 19 15:34:33 [ Thursday ]

## Digital Camera Processing (Enhanced)

- SCC MediaFactory 10 includes updated digital camera SDK's providing support for the latest camera RAW formats.

## Text Converter Channel (Enhanced)

- SCC MediaFactory 10 Text Converter channels significantly enhance XML text processing capability by adding support for XPath "starts-with", "ends-with" and "contains" variables.

- The new XPath variables greatly simplify the style mapping process when the incoming XML data contains a wide variety of styles, and where there is commonality in the naming conventions of related styles.

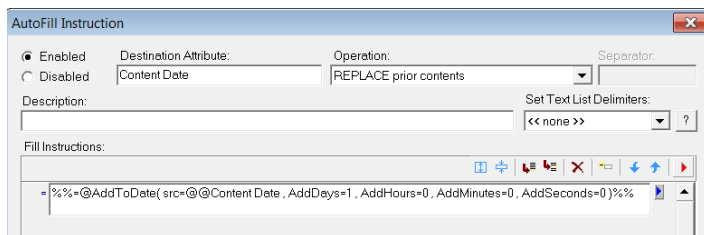

## Image Conversion Channel (Enhanced)

- SCC MediaFactory 10 Image Conversion channels now support the transfer of embedded ICC profiles into TIFF output files.
- SCC MediaFactory 10 Image Conversion channels now support the processing of 16-bit TIFF input files.

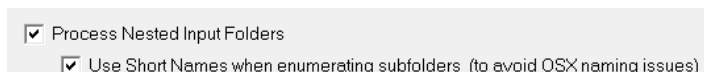

## AutoFill (Enhanced)

- SCC MediaFactory 10 Image Converter, Inserter and ServerOps channels now include an "AddToDate" AutoFill function. The new AutoFill command allows any number of days, hours, minutes or seconds to be automatically added or removed from a source date string contained in the metadata of processed objects.

## Nested Folder Processing (Enhanced)

- SCC MediaFactory 10 provides an option to use the Windows short-name when importing data from a nested input folder tree.
- The short-name option avoids problems where sub-folder names include illegal Windows characters, typically entered from a MacOSX workstation.

## Delivery Channel (Enhanced)

- SCC MediaFactory 10 Delivery channels provide a new "Pad\_Left" Delivery function which allows the values of one or more configured fields to be padded using a predefined character and to a predefined maximum length.
- The new Pad\_Left function is in addition to the Pad\_Right function already available.

## Replication Channel (Enhanced)

- SCC MediaFactory 10 Replication channels now support cloud based storage references.
- The new functionality allows Publisher and Subscriber MediaServer systems to reference the same cloud-based high-resolution objects, avoiding unnecessary storage duplication between primary and DR sites.

## Distribution Channel (Enhanced)

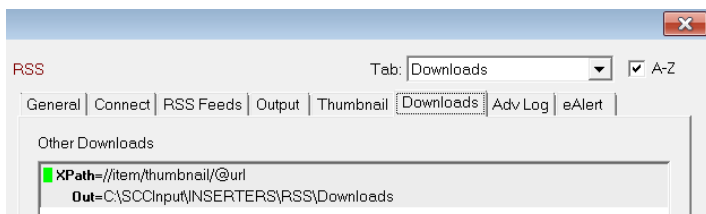

- SCC MediaFactory 10 Distribution channels now provide a new option which controls the order that a configured "coattail" file together with its related sidecar file is copied to the output directory.
- When a metadata sidecar file is configured for coattail processing, enabling the new option ensures that the sidecar file is copied to the output directory prior to the main file.

## Calais Channel (Enhanced)

- SCC MediaFactory 10 Calais channels now support the latest Thomson Reuters Calais Open PermID API.
- The updated Calais API provides access to a new and enhanced tagging engine offering higher quality and higher performance metadata enhancement.

## RSS Reader Channel (Enhanced)

- SCC MediaFactory 10 RSS Reader channels include a new "download links" facility, allowing one or more high-resolution files referenced by pointers contained within the source RSS data feed to be downloaded to a target directory, for subsequent insertion into the SCC MediaServer system. This is in addition to the indexing of the RSS data itself.
- Provides a simple mechanism for agencies to provide access to media without the need to transmit hires data.

## Object Updater Channel (Enhanced)

- SCC MediaFactory 10 Object Updater channels now support the transfer and relinking of TVA row data whenever an object update triggers the movement of MediaServer records from one library to another.

## CCI ObjectML Channel (Enhanced)

- SCC MediaFactory 10 CCI ObjectML channels now provide an option to preserve the original html formatting surrounding tabular content contained in the ObjectML export package.

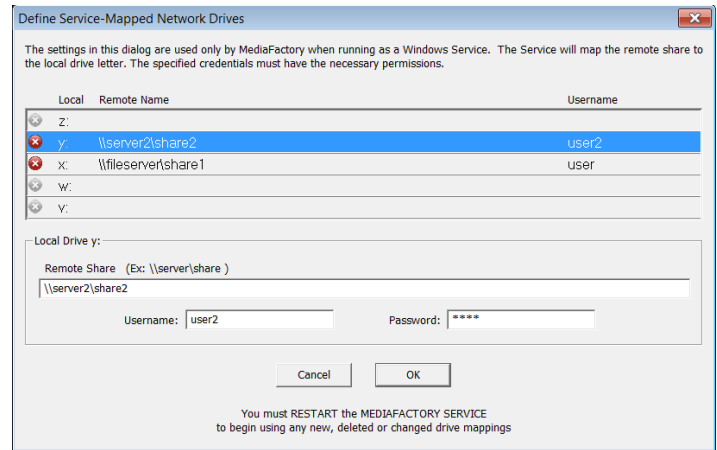

Day: Tuesday

Minnesota	18	14	.563	2 1/2

## Brightcove Integration Channel (Enhanced)

- SCC MediaFactory 10 Brightcove Integration channels now support the filtering of imported video content using custom field metadata held within the source Brightcove portal database.

## Service Mapped Network Drives (New)

- SCC MediaFactory 10 provides a new network drive mapping facility, which allows MediaFactory channels that are configured to monitor network mapped drives, to continue to operate when the MediaFactory application is running in service-mode. Network drive mappings are typically not available for use by a windows service.

## WordPress Media Channel (New)

- SCC MediaFactory 10 includes a new WordPress Media channel type which allows selected media content to be delivered from an SCC MediaServer system and inserted directly into a WordPress Media library.
- Image files delivered from the SCC MediaServer system can be automatically cropped, resized and converted to JPEG, PNG or GIF prior to insertion into the target WordPress system.
